

Architect 2.0 Architecture

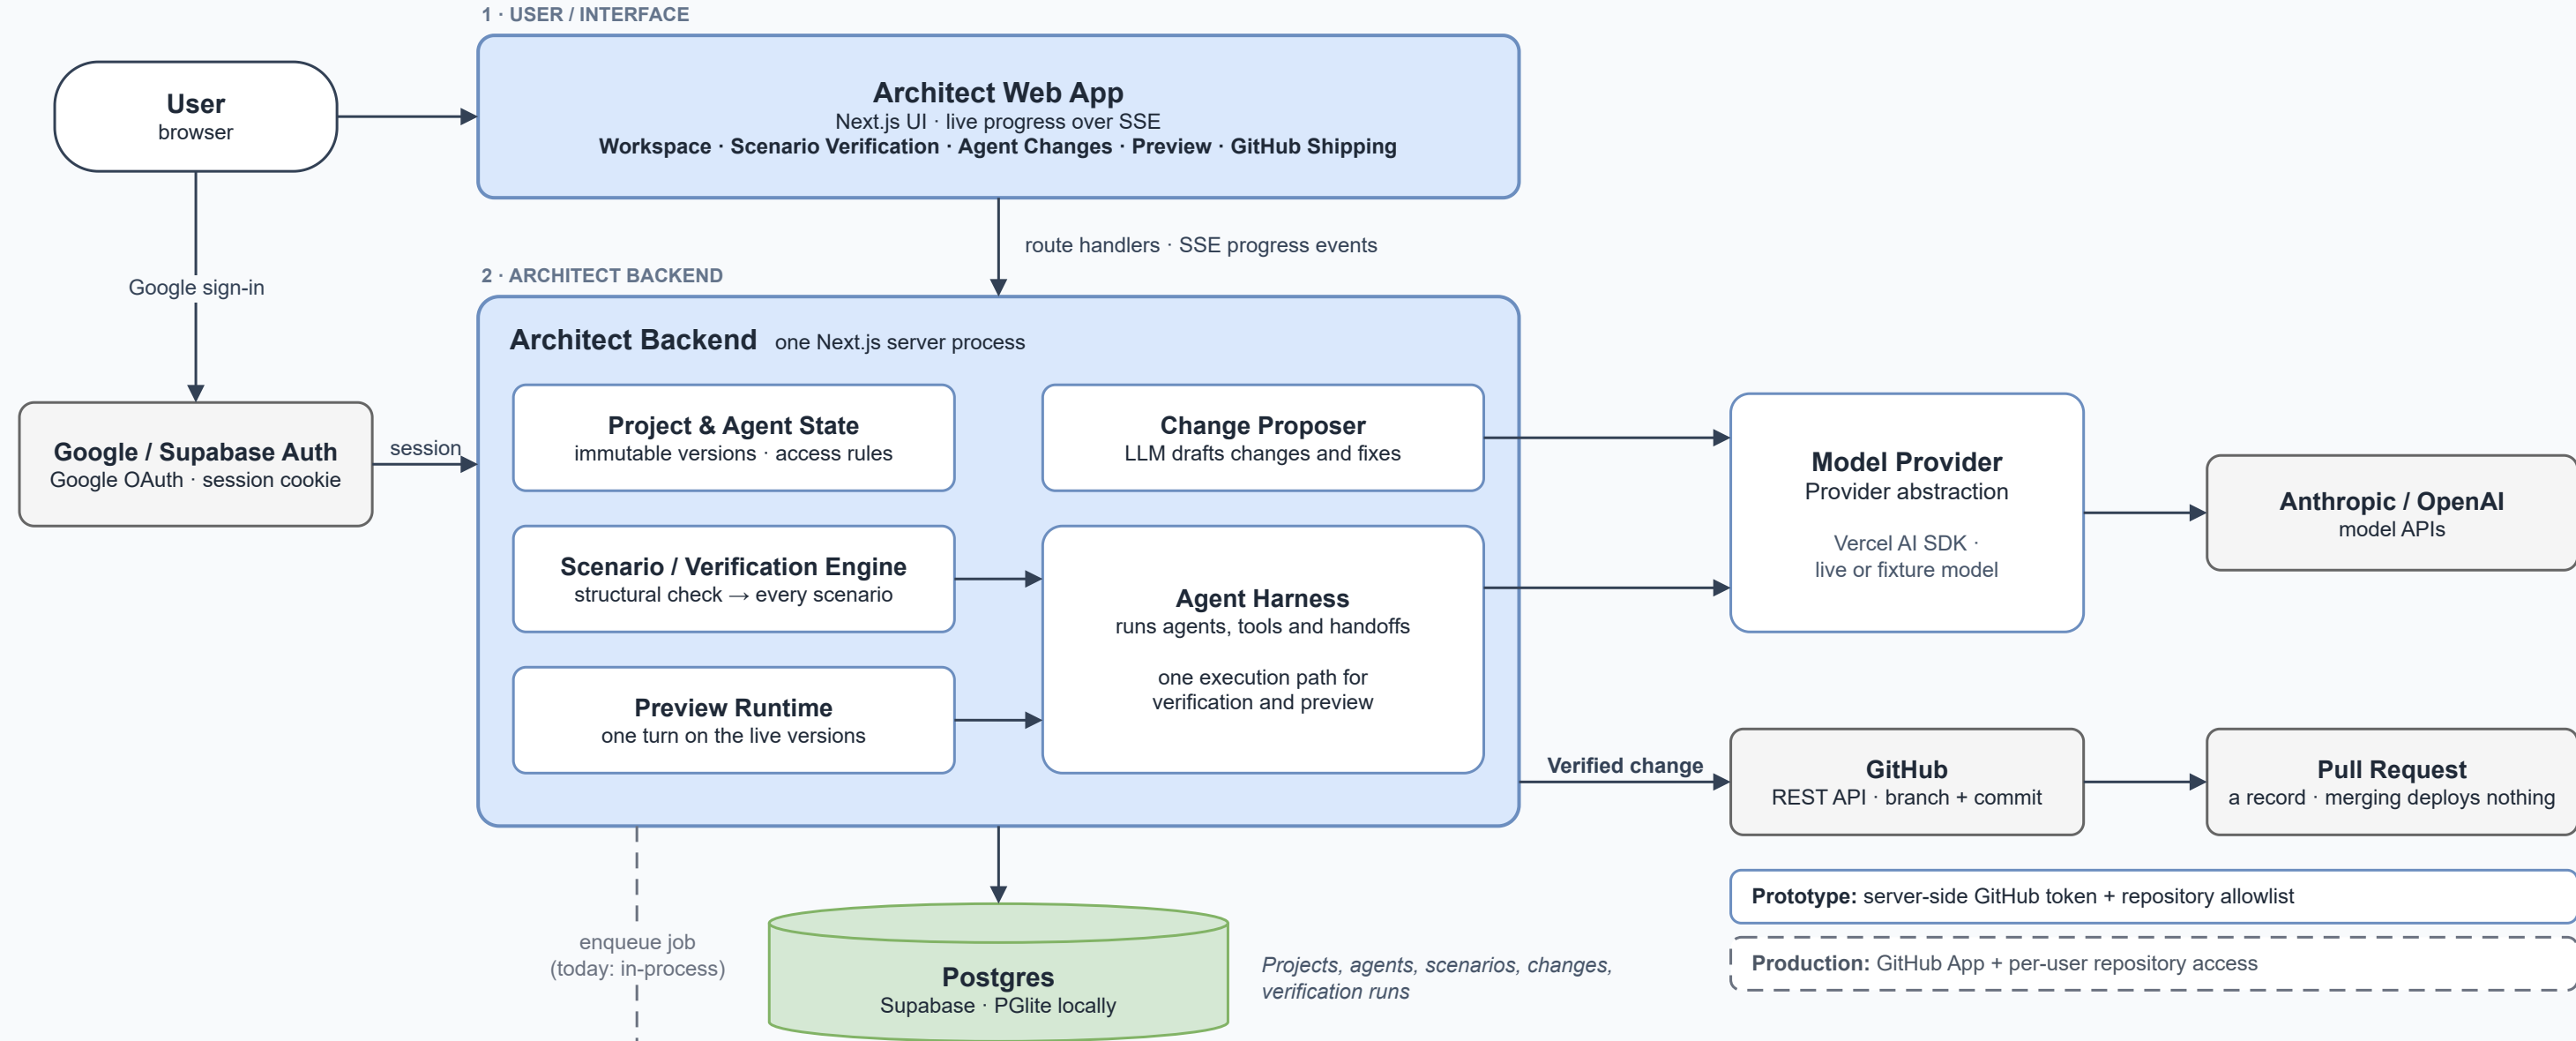

Prototype validates the verification loop; production adds isolation and durable execution.

 Solid = implemented in prototype
 Dashed = production design

THE CORE LOOP
User request → Agent change → Structural verification → Scenario verification → Apply verified change → Preview → GitHub PR
Scenarios + Agent Versions + Verification Runs → persistent state in Postgres

CURRENT PROTOTYPE — implemented

Next.js application · Postgres / PGlite · in-process agent execution · server-side preview · server-side GitHub token · Supabase Google authentication

3 · PRODUCTION EVOLUTION

Production target — designed, not built

- durable workers
- isolated project sandbox
- preview gateway
- GitHub App
- horizontal scaling
